

## HOW COMMON IS PANCREATIC CANCER IN THE UK?

Cancer of the pancreas is part of the Lynch group of cancers but it is one of the least common in the syndrome. Pancreatic cancer is the 10th most common cancer in the UK. Around 8800 people get it in the UK each year, roughly even numbers of men and women.

Pain in the upper abdomen, just under the breast bone, typically “gnawing” in quality and spreading round or through to the back. It tends to be constant but may come and go, worse on laying down, better when leaning forward. It may persist for days or weeks.

Jaundice, affecting skin, whites of eyes and urine which all go bright yellow. Urine does not lighten with drinking more fluids.

Weight loss that is unexplained can be very significant especially with one or two of the other symptoms

## INVESTIGATIONS FOR PANCREATIC CANCER

These are done by a surgical team at hospital with investigations that include blood tests, scans and xrays

## TREATMENT FOR PANCREATIC CANCER

Treatment usually involves surgery together with chemotherapy and/or radiotherapy. The 5 year survival is 6%.<sup>3</sup> The outlook for people with pancreatic cancer has been poor because in most cases it is diagnosed late in the illness and if it has spread to adjacent organs, it may be inoperable. That is why symptom awareness and Europac's new screening trial are especially important for all Lynch syndrome carriers.

## WHAT SCREENING IS AVAILABLE IN THE UK FOR PANCREATIC CANCER IN LS?

Screening has not yet been proven to improve the outcome of pancreatic cancer in the UK and is not yet generally available in the NHS.

## SCREENING UNDER EUROPAC

Europac is an organization that is doing European trials on screening for pancreatic cancer in Lynch syndrome families in the UK and is accepting the following people onto their trial:-

"Anyone over the age of 40 who is a carrier of a Lynch syndrome related mutation in MLH1, MSH2, MSH6, PMS2 or EPCAM who also has a relative with the same mutation and pancreatic cancer is likely to be considered by Europac for pancreatic cancer screening and should either contact their GP or EUROPAC directly ([europac@liv.ac.uk](mailto:europac@liv.ac.uk)).

EUROPAC will also consider individuals with a Lynch syndrome related mutation if they have a first degree relative who had pancreatic cancer even if it is unknown whether the relative carried the mutation."

Screening is performed at specific NHS hospitals in the UK -

Liverpool , Newcastle, UCH, London, Southampton, Glasgow, Nottingham, Leeds, and Bristol.

You might be offered one or more of the following:-

- \*blood tests such as genetic tests, fasting glucose and CA19-9

- \*EUS (endoluminal ultrasound)

- \*OGD oesophago-gastro-duodenoscopy (endoscope through the stomach and takes samples from the area where pancreas drains into the duodenum)

- \*CT scan (computerized tomography scan)

## OTHER WAYS OF PREVENTING CANCER OF THE PANCREAS IN LS

10% of pancreatic cancers are genetic but the following factors also play a part.

- \*Take aspirin long term (dose at least 100mg daily)

- \*Don't smoke

- \*Keep your weight normal and prevent diabetes by eating healthy, low sugar diet
